

REPORTE ANUAL DE LA ACTIVIDAD SÍSMICA EN GUATEMALA

AÑO 2021

DEPARTAMENTO DE INVESTIGACIÓN Y SERVICIOS GEOFÍSICOS
-INSIVUMEH

SECCIÓN DE SISMOLOGÍA

VIERNES 2023-02-17 18:40

1. Red Sismica Nacional (RSN)

Para el año 2021 la red sismológica nacional (RSN) contó con 76 sensores sismológicos; en la tabla 1 se describe la información de cada estación: la ubicación, periodo de operación.

Gracias al apoyo brindado por los proyectos:USAID-VDAP-USGS,LIVERPOOL,ATTAC,TULSA-University,KUKAHPAN,MUNIguate ha sido posible la instalación de sensores así como poder darle el mantenimiento de nuestra red sismológica nacional.

Figura 1: Distribución geográfica de las 76 estaciones que operaron durante el año 2021.

Cuadro 1: Listado de estaciones sismológicas de la RSN durante el año 2021

2. Estadística de los sismos registrados durante el año 2021

En el año 2021 se registraron un total de 4601 eventos sísmicos. La magnitud máxima registrada fue de 6.1 y la magnitud mínima de 1.0.

En la Figura 4 se puede ver la distribución temporal y en la tabla 2 se puede ver el conteo de los sismos por mes.

Figura 2: Distribución de las magnitudes de los 4601 eventos sísmicos registrados durante el año 2021.

Figura 3: Localización geográfica de los 268 eventos sísmicos registrados durante el año 2021 con magnitud igual o mayor a 4.5.

Figura 4: Distribución temporal de los 4601 eventos sísmicos registrados durante el año 2021 .

TOTAL	4601

(fin del cuadro)

Figura 5: Mapa donde se muestran agrupados los 4601 eventos sísmicos clasificados según su fuente sísmica registrados para el año 2021

3.1. Zonas sismogénicas

La zonificación utilizada en este boletín está basada en la elaborada por Benito, et al. (2009) para la región del país comprendida en la zona cortical para profundidades menores o iguales a 25 km

3.1.1. Guatemala Pacífico Central (G1)

Comprende la parte superficial de la subducción en el límite Coco-Caribe (CO-CA), entre la Fosa Mesoamericana y la línea de costa. Un evento grande ocurrió en abril de 1902 en el suroccidente de Guatemala con una Ms 7.4 (Pacheco y Sykes, 1992). En esta parte del contacto CO-CA han sido reportados sismos con mecanismos focales de tipo normal y de rumbo (Dean y Drake, 1978). El período medio entre grandes eventos, en la parte superficial e intraplaca de la subducción, ha sido estimado entre 70 y 150 años (White et al., 2004). La zona G1 es una de las zonas de mayor actividad, aunque debe tomarse en cuenta que en esta región, debido a limitaciones geográficas de la Red Sismológica Nacional, las profundidades son difíciles de estimar con precisión, por lo que podrían haber sismos tanto de la placa continental como de la placa oceánica.

Durante el año 2021 se contaron 382 sismos dentro de esta zona. De los cuales 26 fueron sensibles.

3.1.2. Guatemala Antearco (G2)

La región G2, comprende sismos corticales con profundidades de hasta 25 km (algunos podrían ser de subducción, como se explicó anteriormente). Esta comprende la franja costera entre la cadena volcánica y la línea de costa. La sismicidad es baja y espacialmente muy dispersa. No habiendo información de eventos grandes o que hayan causado daños importantes con epicentro en esta zona.

Durante el año 2021 se contaron 87 sismos dentro de esta zona. De los cuales 1 fueron sensibles.

3.1.3. Guatemala Arco Volcánico Oeste (G3)

Es la franja de aproximadamente 40 km de ancho que incluye el Arco Volcánico, desde la región del Volcán Tacaná, en la frontera con México, hasta el Volcán de Atitlán, más o menos en el Centro del Arco. La sismicidad en esta parte del Arco es menor que en la sección oriental.

Durante el año 2021 se contaron 143 sismos dentro de esta zona. De los cuales 2 fueron sensibles.

3.1.4. Guatemala Arco Volcánico Este (G4)

Para las fallas en la franja del Arco Volcánico, White y Harlow (1993) encontraron que el evento de 1930 en el sureste de Guatemala con Mw 6.9 es el mayor asociado a este sistema en toda la región. Asimismo, estos autores indican que la frecuencia de eventos producidos en los sistemas de fallas del Arco Volcánico Centroamericano que han causado daños es de un evento cada 2.5 años durante el siglo XX, a lo largo de toda América Central, desde Guatemala hasta Costa Rica. Esta sección del Arco Volcánico también se caracteriza por la ocurrencia de actividad sísmica tipo enjambre.

Durante el año 2021 se contaron 1543 sismos dentro de esta zona. De los cuales 107 fueron sensibles.

3.1.5. Guatemala-Depresión de Honduras (G5)

Existe una serie de horst y grabenes orientados aproximadamente de Norte a Sur, desde las montañas mayas de Belice hasta el Golfo de Fonseca, que se conoce como Depresión de Honduras, a pesar de que no existe una continuidad entre ellos. Se trata más bien de una zona de cuencas extensionales bordeadas por fallas normales con rumbo Norte. En el sistema de grabenes, el evento de mayor magnitud que afectó a Guatemala fue el de 1934 con Mw 6.2. En el presente reporte, G5 se tomó de la zona más general G5-S5-H1 propuesta por los autores.

Durante el año 2021 se contaron 158 sismos dentro de esta zona. De los cuales 10 fueron sensibles.

3.1.6. Guatemala Polochic Motagua Oeste (G6)

Esta es una zona de fallas paralelas de rumbo E-W y corrimiento lateral izquierdo: Chixoy-Polochic, Motagua y Jocotán-Chamelecón (Plafker, 1976; Mann et. al., 1990). White (1991) estima un período de recurrencia de grandes eventos de 225 ± 50 años. White y Harlow (1993) incluyen, entre los eventos destructivos ocurridos durante el siglo XX y asociados a este límite, dos eventos localizados a, aproximadamente, 50 km al norte de la traza de la Falla Polochic. Si bien estos dos eventos son producto de las deformaciones en el límite Norte América-Caribe, claramente ocurren en fallas secundarias que no necesariamente siguen el rumbo o tipo de mecanismo del sistema Polochic-Motagua. Algunos autores consideran que este sistema de fallas termina en el occidente de Guatemala y SE de México (Ellis, et al, 2019; Guzman-Speziale y Meneses-Rocha, 2000; Guzman-Speziale et al., 1989). Medidas con GPS indican que el desplazamiento relativo es de entre 3.2 y 3.3 mm/año en la falla de Polochic, mientras que en la Falla del Motagua (la que absorbe la mayor parte de la deformación) va de 17.6 mm/año en el extremo oriental a 9.6 mm/año en el extremo occidental (Ellis, et al., 2019; Lyon-Caen et al., 2006).

Durante el año 2021 se contaron 93 sismos dentro de esta zona. De los cuales 18 fueron sensibles.

3.1.7. Guatemala Norte (Petén-Belice y parte del territorio mexicano) (G8)

Esta es una zona de baja sismicidad y especialmente muy dispersa, que comprende el norte de Guatemala, Belice y algunas regiones cercanas del territorio mexicano.

Durante el año 2021 se contaron 21 sismos dentro de esta zona. De los cuales cero fueron sensibles.

(fin del cuadro)

Donde:

Tiempo de origen	Hora en que se generó el sismo (UTC -06:00:00)
Lat	Latitud Norte del epicentro.
Lon	Longitud Oeste del epicentro.
Prof	Profundidad del sismo en kilómetros.
M	Magnitud sísmica estimada.
NST	Número de estaciones que registraron el sismo.
NF	Número de fases.
ZS	Zona Sísmica.
Region	Región epicentral.
*	Evento sísmico que tiene mas de 25 km de error en su localización.
	Eventos sísmicos reportados sensibles
